## 6 Voltage, Temperature, ESD and Thermal Ratings

### 6.1 Absolute Maximum Ratings

Parameters		Min	Max	Unit
V <sub>CC</sub>	Supply voltage range	-0.5	6.5	V
V <sub>I</sub>	Input voltage range	-0.5	6.5	V
V <sub>O</sub>	Voltage range applied to any output in the high-impedance or power-off state	-0.5	6.5	V
V <sub>O</sub>	Voltage range applied to any output in the high or low state	-0.5	V <sub>CC</sub> +0.5	V
I <sub>IK</sub>	Input clamp current	V <sub>I</sub> <0	-50	mA
I <sub>OK</sub>	Output clamp current	V <sub>O</sub> <0	-50	mA
I <sub>O</sub>	Continuous output current		±50	mA
Continuous current through V <sub>CC</sub> or GND			±100	mA
T <sub>J</sub>	Junction temperature under bias		150	°C
T <sub>STG</sub>	Storage temperature range	-65	150	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.

### 6.2 ESD Ratings

ESD		Value	Unit
V(ESD)	Electrostatic discharge	Human-body model (HBM)	4 K
		Charge device model (CDM)	2 K

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

Notes:

- A.  $C_L$  includes probe and jig capacitance.

- B. Waveform 1 is for an output with internal conditions such that the output is low, except when disabled by the output control.

- Waveform 2 is for an output with internal conditions such that the output is high, except when disabled by the output control.

- C. All input pulses are supplied by generators having the following characteristics: PRR 10 MHz, Z = 50.

- D. The outputs are measured one at a time, with one transition per measurement.

- E.  $t_{PLZ}$  and  $t_{PHZ}$  are the same as  $t_{dis}$ .

- F.  $t_{PZL}$  and  $t_{PZH}$  are the same as  $t_{en}$ .

- G.  $t_{PLH}$  and  $t_{PHL}$  are the same as  $t_{pd}$ .

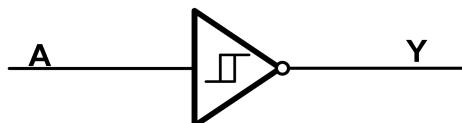

- H. All parameters and waveforms are not applicable to all device.

## 10 Detailed Description

### 10.1 Overview

This device is fully specified for partial-power-down applications using  $I_{off}$ . The  $I_{off}$  circuitry disables the outputs, preventing damaging current back flow through the device when it is powered down.

### 10.2 Functional Block Diagram

### 10.3 Feature Description

The device is designed for 1.65 V to 5.5 V  $V_{CC}$  operation and it allows down voltage translation from 5 V to 3.3 V, or 3.3 V to 1.8 V. Input signals to this device can be driven above the supply voltage so long as they remain below the maximum input voltage value.

The GT74LVC1G14 has power-down protection ( $I_{off}$ ) and Schmitt-trigger input.

The inputs and outputs for this device enter a high impedance state when the supply voltage is 0 V. The maximum leakage into or out of any input or output pin on the device is specified by  $I_{off}$  in the Electrical Characteristics.

The Schmitt-Trigger input makes this device extremely tolerant to slow or noisy inputs. While the inputs can be driven much slower than standard CMOS inputs, it is still recommended to properly terminate unused inputs. Driving the inputs slowly will also increase dynamic current consumption of the device.

## 11 Application Note

### 11.1 Application Information

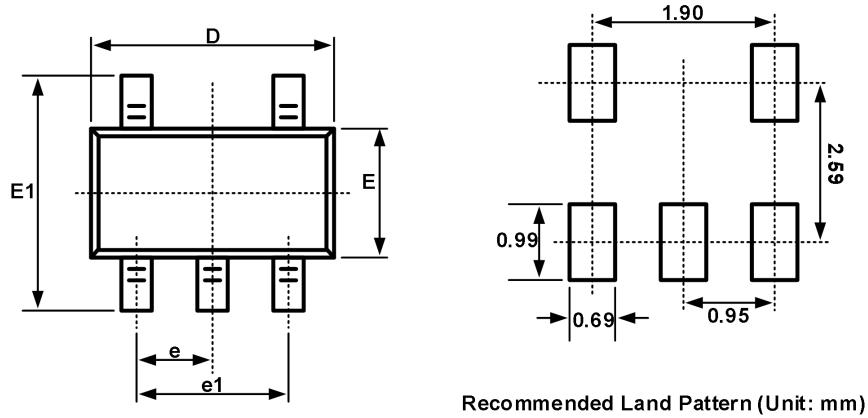

Mechanical input elements, such as push buttons or rotary knobs, offer simple ways to interact with electronic systems. Typically, these elements have recoil or bouncing, where the mechanical element makes and breaks contact multiple times during human interaction. This bouncing can cause one or more repeated signals to be passed, triggering multiple actions when only a single input was intended. One potential solution to mitigating these multiple inputs is by utilizing a Schmitt-trigger to create a debounce circuit.
